

How does Sculptra® Aesthetic Work?

Sculptra Aesthetic gradually replaces lost collagen

Collagen is a key structural component that keeps skin youthful looking and smooth. As you age, your body's collagen production decreases, and you may begin to see wrinkles. Sculptra® Aesthetic (injectable poly-L-lactic acid) works to correct shallow to deep facial wrinkles and folds,* as it replaces lost collagen, which can help provide a refined, more youthful looking appearance.

Sculptra Aesthetic works to replace lost collagen in a series of treatments administered by a Sculptra trained physician. On average, 3 injection sessions are needed over a period of a few months. The number of injection sessions and the number of injections per session vary from person to person.

Sculptra Aesthetic works within the deep dermis

Within the deep dermis, your skin's structure is reinforced as Sculptra Aesthetic helps to replace lost collagen. This reinforced collagen structure provides a foundation that gradually restores the look of fullness of your shallow to deep facial wrinkles and folds* that has been depleted over time. The result? Sculptra Aesthetic is different because it gradually and subtly corrects these facial wrinkles. This can provide a refined, more youthful looking appearance that can last up to 2 years.**

Side effects of Sculptra Aesthetic may include injection site discomfort, redness, bruising, bleeding, itching, and swelling.

*Safety and effectiveness of Sculptra Aesthetic have not been evaluated in areas other than nasolabial wrinkles and folds in clinical trials.

**Individual results and treatment sessions may vary.

***Based on pre-clinical evaluation in animals. Sculptra Aesthetic is thought to work in a similar process.
